

CT Chest With Contrast · Synthetic Demo Report

Educational sample only · synthetic demo, not a real patient report.

EXAM:

CT chest with intravenous contrast.

CLINICAL HISTORY:

Abnormal chest radiograph with suspected right upper lobe opacity.

TECHNIQUE:

Helical CT of the chest was performed after IV contrast administration.

COMPARISON:

Chest radiograph from the same day.

FINDINGS:

Several discrete patchy air-space opacities are present in the right upper lobe, most compatible with infiltrate. The remainder of the lung parenchyma is clear. No pneumothorax or pleural effusion. Heart size and pulmonary vessels are unremarkable. No axillary, hilar, or mediastinal lymphadenopathy. Upper abdominal images are unremarkable. Osseous structures show no acute finding.

IMPRESSION:

Patchy right upper lobe air-space opacities, compatible with pneumonia.

RECOMMENDATIONS:

Clinical correlation and follow-up imaging after treatment as appropriate.
